SUMMARY

Computer Science graduate (B.Tech, 2026) focused on Linux, containers and CI/CD. I containerized and deployed a FastAPI and PostgreSQL service with Docker, a GitHub Actions pipeline and a Render and Neon setup defined in code. I also built a Jenkins pipeline for Android ROM builds that cut manual build time by 60%. I do most of my development on Linux, using Bash and Git.

SKILLS

Linux & Scripting: Linux, Bash, Shell Scripting, Python
Containers: Docker, Docker Compose
CI/CD & Version Control: GitHub Actions, Jenkins, Git, GitHub
Cloud & Hosting: AWS, Render, Neon (serverless PostgreSQL), Vercel, Firebase
Infrastructure as Code: Render Blueprint (render.yaml), Docker Compose
Databases: PostgreSQL, pgvector, Alembic (schema migrations)
Observability & Build: Health and readiness checks, structured logging, AOSP build system (Soong/Make)
Languages: Python, Bash, SQL, C, C++

PROFESSIONAL EXPERIENCE

Embedded Systems Intern, Genesys, Palakkad 03/2024 – 04/2024

- Integrated Arduino-based monitoring into medical devices, streaming sensor readings to Firebase in real time.
- Developed a web platform for device monitoring that cut manual monitoring effort by 40%.

Developer and Logistician, 3rdEra (Clothing Store) 06/2023 – 08/2023

- Made 15+ UI/UX improvements to the company website in Framer to simplify navigation.
- Ran the Shopify backend, logistics and customer support; sales grew 30% over this period.

PROJECTS

Supplier Finder: Containerized AI Sourcing Service | GitHub | Live Demo
Tech: Docker, Docker Compose, GitHub Actions, Render, Neon PostgreSQL, FastAPI, Linux

- Containerized a FastAPI and PostgreSQL (pgvector) service as 2 Docker Compose services. The app container applies Alembic migrations on start and listens on whatever port the host provides.
- Automated testing with GitHub Actions CI that starts a pgvector Postgres service container and runs Ruff and 74 pytest tests on every push and pull request.
- Defined the deployment as code with a Render Blueprint and a Neon serverless Postgres database. All 4 secrets stay in environment variables, and every push to main redeploys automatically.
- Exposed /health and /health/ready endpoints and request-ID logging. The readiness check reports how many of the 500 vendor records are searchable, so a half-loaded index shows up before users hit it.
- Cut first-boot data seeding from about 5 minutes to 3 seconds by shipping precomputed embeddings, and made seeding resumable with commits every 50 records.
- Implemented client-side rate limiting (14 requests per minute) and retry handling for Gemini API 429 errors, with a rule-based fallback so the service stays up when the quota runs out.

Android Custom ROM Development
Tech: AOSP, Linux, Android Build System (Soong/Make), Device Trees, Git, Jenkins

- Compiled a custom Android ROM on Linux from AOSP source, configuring device trees and vendor blobs, and automated its builds with a Jenkins CI/CD pipeline that cut manual build time by 60%.

EDUCATION

B.Tech in Computer Science, Institute of Engineering and Technology, Udaipur 2022 – 2026
Class 12 (CBSE), The Shanti Niketan School, Jodhpur: 76.2% 2021
Class 10 (CBSE), Central Academy School, Jodhpur: 85% 2019
